

Anti-Ligature Furniture

By ensuring safety, you're reducing fear and anxiety for patients and their families, starting them on the path to healing.

When a patient arrives at your treatment center, consider how powerful it can be to offer loved ones the peace of knowing your facility is safe.

Furniture that reduces patient self-harm:

Furniture safety begins with anti-ligature features—especially for moderate and high-risk populations.

We offer two groups of Anti-Ligature Furniture:

Molded Plastic and **Solid Wood.**

Both groups offer:

- Beds, storage, desks, tables and chairs.
- Are continuous pieces with no opportunity for rope or cord attachment.
- Taller storage cabinets or wardrobes can have sloped tops to prevent both contraband and places that could be used for hanging or self mutilation.
- Open shelving allow for easy inspection for contraband items and prevents small, breakable parts like drawer boxes, drawer fronts and hardware.

The safety element of this ligature-resistant furniture decreases the risk that patients would be able to self-harm.

Extra attention has been paid to self-harm in the past year across the entire healthcare landscape. At the Joint Commission's 2018 Hospital Executive Briefing in New York in September, Chief Medical Officer Ana Pujols McKee said that providers should accept nothing less than zero harm in their facilities.

Style isn't Sacrificed.

Providers of all types must be mindful of safety. However, style and comfort doesn't need to be overlooked.

The safety aspects of our molded plastic furniture and low-profile wood beds can be easily integrated with your center's design thanks to the many style choices and colors that allow for a warm homelike feel. Wood finishes include modern choices such as black, honey brown and coffee. Our consultants can work closely with you to customize a dignified, welcoming treatment space that makes all the difference.
